# Shara™

Lomandra fluviatilis 'ABU7' 

## What makes it a great choice for landscape is its height.

Shara is a fine leaf Lomandra with slight blue grey tones. It grows to about 400mm high with a spread of about 500mm. Common Lomandra fluviatilis grows significantly higher. Shara is very Phytophthora tolerant. It can tolerate periodic wet feet, but not permanent wet. It is also very drought tolerant. Shara has more flowers than most forms, and its flowers sit well above the foliage. It also keeps its colour in heavy frosts. It is an ideal choice for mass planting where a low growing tidy tough plant is needed.

*Drought tolerant and tough*

*Flowering above the Foliage*

Shara has tested well in the humidity of Brisbane and Sydney for 3 years, with so far no sign of death due to root rot and is currently being tested further north. It has also done well in some colder climates and has survived and stayed evergreen in -5°C frosts. So far this is proving to be a good lower growing alternative for Tanika, particularly for more humid climates. It is a smaller size, so we recommend planting at 8 per square metre as a blanket ground cover.

## Compact and disease resistant

STRAPPY LEAF PLANTS

DESCRIPTION Fine leaf, compact Lomandra with blue grey tones  
HEIGHT & WIDTH 40cm x 50cm  
POSITION Full sun to moderate shade  
CARE Almost no maintenance. Trim as required  
USES Mass planting in wet and dry areas  
SOIL TYPE Tolerates a wide variety of soil types
